ICMseries Accessories: Coupling Devices

The Power Diagnostix line of coupling devices includes quadrupoles, current transformers, and coupling capacitors to adapt Power Diagnostix PD detectors to different measurement tasks. The coupling device in a PD measuring circuit provides the means of sensing the partial discharge pulse and sending it as a voltage signal to a preamplifier for conditioning.

The coupling device can be a capacitor and a quadrupole, a capacitor and a current transformer, or a current transformer alone. The standard capacitor for tand measurements, such as the SC30, consists of a capacitor and a built-in shunt capacitor, only. Additionally, combined units for tand and partial discharge measurements are available.

Coupling Capacitors

Power Diagnostix standard coupling capacitors are mounted on sturdy cast aluminum enclosures and can be used for on-line and off-line measurements on rotating machines as well as for a variety of smaller test setups. A wider range of coupling capacitors and capacitor assemblies complete with quadrupoles and

preamplifiers is available on request. The table below lists some standard models of coupling capacitors provided by Power Diagnostix, along with their built-in circuits, if present.
